#### Abstract

The non- homogeneous ternary quadratic diophantine equation $8\left(x^{2}+y^{2}\right)-15 x y+2(x+y)+4=47 z^{2}$ is analyzed for its patterns of non-zero distinct integral solutions. Various interesting relations between the solutions and special numbers namely polygonal, Pronic and Gnomonic numbers are exhibited.

Keywords: Ternary quadratic; Non-homogeneous quadratic; Integer solutions.

## 1. Introduction

It is well known that ternary quadratic diophantine equations are rich in variety [1-17]. This paper concerns with another interesting quadratic diophantine equation with three unknowns $8\left(x^{2}+y^{2}\right)-15 x y+2(x+y)+4=47 z^{2}$ for determining its infinitely many non-zero integral solutions. Various interesting relations between the solutions and special numbers namely polygonal, Pronic and Gnomonic numbers are exhibited.

### 1.1. Notations

- $\mathrm{t}_{\mathrm{m}, \mathrm{n}}=\mathrm{n}\left[1+\frac{(\mathrm{n}-1)(\mathrm{m}-2)}{2}\right]=$ Polygonal number of rank n with sides m
- $\operatorname{Pr}_{\mathrm{n}}=\mathrm{n}(\mathrm{n}+1)=$ Pronic number of rank n
- $\mathrm{GN}(\mathrm{n})=2 \mathrm{n}+1=$ Gnomonic number

## 2. Method of Analysis

The Ternary quadratic equation to be solved for its non-zero distinct integral solution is $8\left(x^{2}+y^{2}\right)-15 x y+2(x+y)+4=47 z^{2}$
Introduction of the linear transformations
$\mathrm{x}=\mathrm{u}+\mathrm{v}, \mathrm{y}=\mathrm{u}-\mathrm{v} \quad,(\mathrm{u} \neq \mathrm{v} \neq 0)$
in (1) leads to
$\mathrm{U}^{2}+31 \mathrm{v}^{2}=47 \mathrm{z}^{2}$
where
$\mathrm{U}=\mathrm{u}+2$
Solving (3) through different methods, different sets of integer solutions to (1) are obtained.

### 2.1. Method 1

(3) is written in the form of ratio as
$\frac{(\mathrm{U}+4 \mathrm{z})}{(\mathrm{z}-\mathrm{v})}=\frac{31(\mathrm{z}+\mathrm{v})}{(\mathrm{U}-4 \mathrm{z})}=\frac{\alpha}{\beta}, \beta \neq 0$
which is equivalent to the system of equations

$$
\begin{gather*}
U \beta+v \alpha+z(4 \beta-\alpha)=0  \tag{5}\\
-U \alpha+31 v \beta+z(4 \alpha+31 \beta)=0
\end{gather*}
$$

$\left.\begin{array}{l}\mathrm{u}=4 \alpha^{2}+62 \alpha \beta-124 \beta^{2}-2 \\ \mathrm{v}=\alpha^{2}-8 \alpha \beta-31 \beta^{2} \\ \mathrm{z}=\alpha^{2}+31 \beta^{2}\end{array}\right\}$
Substituting the values of $u \& v$ in (2), we get
$\left.x=x(\alpha, \beta)=5 \alpha^{2}+54 \alpha \beta-155 \beta^{2}-2\right\}$
$y=y(\alpha, \beta)=3 \alpha^{2}+70 \alpha \beta-93 \beta^{2}-2$
Thus (6) \& (7) represent the non-zero distinct integral solutions of (1).
A few numerical examples are presented in Table 1 below:

| Table-1. Numerical examples |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| $\alpha$ | $\beta$ | X | y | Z |
| 1 | 1 | -98 | -22 | 32 |
| 2 | 1 | -29 | 57 | 35 |
| 3 | 1 | 50 | 142 | 40 |
| 4 | 1 | 139 | 212 | 47 |

### 2.2. Properties

- $y(1, \beta)+93 \operatorname{pr}_{\beta}-G N(\beta)-322 t_{3, \beta}+161 t_{4, \beta}=0$
- $\quad \mathrm{x}(\alpha, 1)-\mathrm{t}_{12, \alpha}+1 \equiv \mathrm{O}(\bmod 2)$
- $\mathrm{x}(\alpha, 1)+\mathrm{z}(\alpha, 1)-54 \mathrm{pr}_{\alpha}+54 \mathrm{t}_{4, \alpha}+126$.
is a nasty number.
From the values of $\mathrm{x}, \mathrm{y}$ and z in Table 1,one may obtain second order Ramanujan numbers. For illustration, consider

$$
\begin{aligned}
\mathrm{x}_{1} & =-98 \\
& =98 *(-1)=49 *(-2)=14 *(-7)
\end{aligned}
$$

Now,

$$
\begin{gathered}
98^{*}(-1)=49^{*}(-2) \Rightarrow 97^{2}+51^{2}=99^{2}+47^{2} \Rightarrow 12010 \\
49 *(-2)=14^{*}(-7) \Rightarrow 47^{2}+21^{2}=51^{2}+7^{2} \Rightarrow 2650
\end{gathered}
$$

Thus 12010, 2560 are second order Ramanujan number whose base numbers are Real integers.

## Note:

(3) is also written in the form of ratio as

$$
\frac{(U-4 z)}{31(z-v)}=\frac{(z+v)}{(U+4 z)}=\frac{\alpha}{\beta}, \beta \neq 0
$$

Following the procedure as above, the corresponding integer solutions to (1) are given by

$$
\begin{aligned}
& x=x(\alpha, \beta)=-93 \alpha^{2}+70 \alpha \beta+3 \beta^{2}-2 \\
& y=y(\alpha, \beta)=-155 \alpha^{2}+54 \alpha \beta+5 \beta^{2}-2 \\
& z=z(\alpha, \beta)=31 \alpha^{2}+\beta^{2}
\end{aligned}
$$

A few numerical examples are presented in Table 2 below:

Table-2. Numerical examples

| $\alpha$ | $\beta$ | X | y | Z |
| :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | 202 | 158 | 32 |
| 2 | 1 | 721 | 507 | 125 |
| 3 | 1 | 1550 | 1042 | 280 |
| 4 | 1 | 2689 | 1763 | 497 |

### 2.3. Properties

- $\mathrm{x}(\alpha, 1)-\mathrm{y}(\alpha, 1)-46 \mathrm{pr}_{\alpha}-108 \mathrm{t}_{3, \alpha}+54 \mathrm{t}_{4, \alpha}+17$ is a perfect square.
- $\mathrm{x}(1, \beta)+5 \mathrm{pr}_{\beta}-\mathrm{GN}(\beta) \equiv 152(\bmod 57)$
- $\mathrm{y}(\alpha, 1)-\mathrm{z}(\alpha, 1)-75 \mathrm{pr}_{\alpha}+75 \mathrm{t}_{4, \alpha}-\mathrm{t}_{18, \alpha}-\mathrm{GN}(\alpha)+7$ is a nasty number.

### 2.4. Method 2

Introducing the linear transformations $z=X+31 T, v=X+47 T, U=4 W$
in (3), we have
$\mathrm{X}^{2}-\mathrm{W}^{2}=1457 \mathrm{~T}^{2}$
which is satisfied by

$$
\begin{equation*}
\mathrm{T}=2 \mathrm{rs}, \mathrm{~W}=1457 \mathrm{r}^{2}-\mathrm{s}^{2}, \mathrm{X}=1457 \mathrm{r}^{2}+\mathrm{s}^{2} \tag{9}
\end{equation*}
$$

In view of (8), (4) and (2),the corresponding integer solutions to (1) are given by

$$
\begin{aligned}
& x(r, s)=7285 r^{2}+94 r s-3 s^{2}-2 \\
& y(r, s)=4371 r^{2}-94 r s-5 s^{2}-2 \\
& z(r, s)=1457 r^{2}+62 r s+s^{2}
\end{aligned}
$$

A few numerical examples are presented in Table 3 below:

| Table-3. Numerical examples |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| r | S | X | y | Z |
| 1 | 1 | 7374 | 4270 | 1520 |
| 1 | 2 | 7459 | 4161 | 1585 |
| 1 | 3 | 7538 | 4042 | 1652 |
| 1 | 4 | 7611 | 3913 | 1721 |

### 2.5. Properties

- $\quad \mathrm{x}(1, \mathrm{~s})+3 \mathrm{pr}_{\mathrm{s}} \equiv 7283(\bmod 97)$
- $x(r, 1)-z(r, 1)-5828 \mathrm{pr}_{\mathrm{r}}+11538 \mathrm{t}_{3, \mathrm{r}}-5796 \mathrm{t}_{4, \mathrm{r}}+6=0$
- $z(1, s)-496$ is a perfect square

Also, (9) can be expressed as the system of double equations as presented below in Table 4:
Table-4. System of Double Equations

| Table-4. System of Double Equations |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| System | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ |
| $\mathrm{X}+\mathrm{W}$ | $\mathrm{T}^{2}$ | $31 \mathrm{~T}^{2}$ | $47 \mathrm{~T}^{2}$ | $\mathbf{1 4 5 7 \mathrm { T }}$ | 47 T |
| $\mathrm{X}-\mathrm{W}$ | 1457 | 47 | 31 | T | 31 T |

Solving each of the above system of equations, the values of $\mathrm{X}, \mathrm{W}$ and T are obtained.
In view of (8), (4) and (2), the corresponding integer solutions to (1) are obtained. For simplicity, we present below the corresponding solutions to (1) with a few properties.

Solutions from system 1:

$$
\begin{aligned}
& x=10 k^{2}+104 k-2138 \\
& y=6 k^{2}-88 k-3690 \\
& z=2 k^{2}+64 k+760
\end{aligned}
$$

A few numerical examples are presented in Table 5 below:
Table-5. Numerical examples

| k | X | y | Z |
| :--- | :--- | :--- | :--- |
| 1 | -2024 | -3772 | 826 |
| 2 | -1890 | -3842 | 896 |
| 3 | -1736 | -3900 | 970 |
| 4 | -1562 | -3946 | 1048 |

### 2.6. Properties

- $\quad \mathrm{x}-\mathrm{y}-4 \mathrm{pr}_{\mathrm{k}} \equiv 0(\bmod 2)$
- $\mathrm{z}-\mathrm{GN}\left(\mathrm{k}^{2}\right)+64 \mathrm{pr}_{\mathrm{k}}+64 \mathrm{t}_{4, \mathrm{k}}-759=0$
- $5 \mathrm{z}-\mathrm{y}+\mathrm{t}_{34, \mathrm{k}}+247 \mathrm{pr}_{\mathrm{k}}+9 \mathrm{t}_{4, \mathrm{k}}+110$ is a perfect square

Solutions from system 2:

$$
\begin{aligned}
& \mathrm{x}=310 \mathrm{k}^{2}+404 \mathrm{k}+52 \\
& \mathrm{y}=186 \mathrm{k}^{2}+92 \mathrm{k}-120 \\
& \mathrm{z}=62 \mathrm{k}^{2}+124 \mathrm{k}+70
\end{aligned}
$$

A few numerical examples are presented in Table 6 below:
Table-6. Numerical examples

| k | X | y | z |
| :--- | :--- | :--- | :--- |
| 1 | 766 | 158 | 256 |

| 2 | 2100 | 808 | 558 |
| :--- | :--- | :--- | :--- |
| 3 | 4054 | 1830 | 988 |
| 4 | 6628 | 3224 | 1542 |

### 2.7. Properties

- $\quad \mathrm{x}-\mathrm{y}-124 \mathrm{pr}_{\mathrm{k}} \equiv 0(\bmod 2)$
- $\mathrm{y}+\mathrm{z}-98 \mathrm{pr}_{\mathrm{k}}-\mathrm{GN}(\mathrm{k})-224 \mathrm{t}_{3, \mathrm{k}}+112 \mathrm{t}_{4, \mathrm{k}}+51_{\text {is a nasty number }}$
- $y-t_{36, \mathrm{k}}-108 \mathrm{pr}_{\mathrm{k}}+108 \mathrm{t}_{4, \mathrm{k}}+120$ is a perfect square

Solutions from system 3:

$$
\begin{aligned}
& x=470 k^{2}+564 k+116 \\
& y=282 k^{2}+188 k-56 \\
& z=94 k^{2}+156 k+70
\end{aligned}
$$

A few numerical examples are presented in Table 7 below:
Table-7. Numerical examples

| k | X | y | Z |
| :--- | :--- | :--- | :--- |
| 1 | 1150 | 414 | 320 |
| 2 | 3124 | 1448 | 758 |
| 3 | 6038 | 3046 | 1384 |
| 4 | 9892 | 5208 | 2198 |

### 2.8. Properties

- $\mathrm{z}-188 \mathrm{t}_{3, \mathrm{k}}-\mathrm{GN}(\mathrm{k}) \equiv 0(\bmod 3)$
- $\mathrm{y}-188 \mathrm{pr}_{\mathrm{k}}+195 \mathrm{t}_{4, \mathrm{k}}+56$ is a perfect square
- $\mathrm{x}-\mathrm{z}-\mathrm{t}_{754, \mathrm{k}}-803 \mathrm{pr}_{\mathrm{k}}+803 \mathrm{t}_{4, \mathrm{k}}-46=0$

Solutions from system 4:

$$
\begin{aligned}
& x=3688 T-2 \\
& y=2136 T-2 \\
& z=760 T
\end{aligned}
$$

A few numerical examples are presented in Table 8 below:
Table-8. Numerical examples

| Table-8. Numerical examples |  |  |  |
| :--- | :--- | :--- | :--- |
| T | X | y | Z |
| 1 | 3686 | 2134 | 760 |
| 2 | 7374 | 4270 | 1520 |
| 3 | 11062 | 6406 | 2280 |
| 4 | 14750 | 8542 | 3040 |

### 2.9. Properties

- $\mathrm{z}-\mathrm{x}-2928 \mathrm{pr}_{\mathrm{T}}-24 \mathrm{~T}^{2}-2$ is a nasty number
- $y-2 x+5240 \mathrm{pr}_{\mathrm{T}}-56 \mathrm{t}_{4, \mathrm{~T}}-2$ is a perfect square
- $\mathrm{z}-760 \mathrm{pr}_{\mathrm{T}}+760 \mathrm{t}_{4, \mathrm{~T}}=0$

Solutions from system 5:

$$
\begin{aligned}
& \mathrm{x}=118 \mathrm{~T}-2 \\
& \mathrm{y}=-54 \mathrm{~T}-2 \\
& \mathrm{z}=70 \mathrm{~T}
\end{aligned}
$$

A few numerical examples are presented in Table 9 below:

Table-9. Numerical examples

| Table-9. Numerical examples |  |  |  |
| :--- | :--- | :--- | :--- |
| T | X | y | Z |
| 1 | 116 | -56 | 70 |

| 2 | 234 | -110 | 140 |
| :--- | :--- | :--- | :--- |
| 3 | 352 | -164 | 210 |
| 4 | 470 | -218 | 280 |

### 2.10. Properties

- $y-x+172{p r_{T}}-3 t_{4, \mathrm{~T}}$ is a perfect square
- $2 \mathrm{y}-\mathrm{z}+178 \mathrm{pr}_{\mathrm{T}}-28 \mathrm{t}_{4, \mathrm{~T}}+4$ is a nasty number
- $\mathrm{x}-236 \mathrm{t}_{3, \mathrm{~T}}+\mathrm{t}_{238, \mathrm{~T}}+117 \mathrm{pr}_{\mathrm{T}}-117 \mathrm{t}_{4, \mathrm{~T}}+2=0$

### 2.11. Method 3:

47 is written as
$47=(4+i \sqrt{31})(4-i \sqrt{31})$
Also $\mathrm{z}=\alpha^{2}+31 \beta^{2}$
Substituting (11) and (10) in (3) and employing the factorization method, define

$$
\begin{equation*}
(U+i \sqrt{31} v)=(4+i \sqrt{31})(\alpha+i \sqrt{31} \beta)^{2} \tag{11}
\end{equation*}
$$

On equating real and imaginary parts and using (4), we have

$$
\begin{gathered}
v=\alpha^{2}+8 \alpha \beta-31 \beta^{2} \\
u=4 \alpha^{2}-62 \alpha \beta-124 \beta^{2}-2
\end{gathered}
$$

In view of (2), we have

$$
\left.\begin{array}{l}
x=5 \alpha^{2}-62 \alpha \beta-124 \beta^{2}-2 \\
y=3 \alpha^{2}-70 \alpha \beta-93 \beta^{2}-2 \tag{12}
\end{array}\right\}
$$

Thus (11) and (12) represent the non-zero distinct integral solutions of (1). A few numerical examples are presented in Table 10 below:

Table-10. Numerical examples

| $\alpha$ | $\beta$ | X | y | Z |
| :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | -206 | -162 | 32 |
| 2 | 1 | -245 | -223 | 35 |
| 3 | 1 | -274 | -278 | 40 |
| 4 | 1 | -293 | -327 | 47 |

- $x(\alpha, \beta)-t_{12, \alpha}+50 \operatorname{pr}_{\alpha}-14 \mathrm{t}_{4, \alpha}+157$ is a perfect square
- $y(\alpha, \beta)+z(\alpha, \beta)-t_{10, \alpha}+67 \mathrm{pr}_{\alpha}-13 \mathrm{t}_{4, \alpha}+64$ i is a nasty number
- $y(1, \beta)-42 \mathrm{t}_{3, \beta}+93 \operatorname{pr}_{\beta}+21 \mathrm{t}_{4, \beta}-\mathrm{GN}(\beta)=0$

### 2.12. Method 4:

One may write (3) as
$\mathrm{U}^{2}+31 \mathrm{v}^{2}=47 \mathrm{z}^{2} * 1$
Write 1 as
$1=\frac{(15+\mathrm{i} \sqrt{31})(15-\mathrm{i} \sqrt{31})}{256}$
Substituting (10), (11) and (14) in (13) and employing the factorization method, define

$$
\begin{equation*}
(\mathrm{U}+\mathrm{i} \sqrt{31} \mathrm{v})=(4+\mathrm{i} \sqrt{31})(\alpha+\mathrm{i} \sqrt{31} \beta)^{2} \frac{(15+\mathrm{i} \sqrt{31})}{16} \tag{14}
\end{equation*}
$$

Following the procedure as in Method 3, the corresponding integer solutions to (1) Are found to be

$$
\left.\begin{array}{c}
\mathrm{z}=256 \chi^{2}+7936 \delta^{2} \\
x=768 \chi^{2}-17920 \chi \delta-23808 \delta^{2}-2 \\
y=160 \chi^{2}-19776 \chi \delta-4960 \delta^{2}-2
\end{array}\right\}
$$

A few numerical examples are presented in Table 11 below:

| $\chi$ | $\delta$ | x | y | Z |
| :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | -40962 | -24578 | 8192 |
| 2 | 1 | -56578 | -43874 | 8960 |
| 3 | 1 | -70658 | -62850 | 10240 |
| 4 | 1 | -83202 | -81506 | 12032 |

### 2.13. Properties

- $\mathrm{x}(\chi, 1)-\mathrm{t}_{86, \chi}+\mathrm{GN}(\chi)+\mathrm{t}_{35756, \chi}-17878 \mathrm{t}_{4, \mathrm{x}}+23809$ is a nasty number
$x(1, \delta)-y(1, \delta)+18848 \operatorname{pr}_{\delta} \equiv 0(\bmod 2)$
$x(1, \delta)+z(1, \delta)+15872 \operatorname{pr}_{\delta} \equiv 0(\bmod 2)$
Note: It is noted that 1 may also be expressed as

$$
\begin{aligned}
& 1=\frac{\left(2 \mathrm{k}^{2}+2 \mathrm{k}-15\right)^{2}+31(2 \mathrm{k}+1)^{2}}{\left(2 \mathrm{k}^{2}+2 \mathrm{k}+16\right)^{2}} \\
& 1=\frac{\left(31 \mathrm{r}^{2}-\mathrm{s}^{2}\right)^{2}+31(2 \mathrm{rs})^{2}}{\left(31 \mathrm{r}^{2}+\mathrm{s}^{2}\right)^{2}}
\end{aligned}
$$

Employing (10) and (11) along with the above values of 1 respectively on the R.H.S of (13), two more sets of integer solutions to (1) are obtained.

## 3. Conclusion

In this paper, an attempt has been made to obtain many non-zero distinct integers solutions to the quadratic equation with three unknowns represented by $8\left(x^{2}+y^{2}\right)-15 x y+2(x+y)+4=47 z^{2}$ through employing linear transformations and method of factorization. To conclude, one may search for integer solutions to quadratic equations with four or more variables along with suitable relations among the solutions.
